WILLIAM GRIFFIN

Full-Stack Software Engineer | React · TypeScript · Node.js · Python | PostgreSQL | AWS · Docker | REST & GraphQL
(832) 557-4731 • griffin.william@outlook.com • linkedin.com/in/griffin-w/ • Houston, TX

Summary

Full-Stack Software Engineer with 6 years of experience building and shipping production web applications across the stack, React and TypeScript front ends on Node.js, Express, and Python back ends with PostgreSQL. At Ascend SC I spent three years on enterprise supply chain applications serving 200+ internal and client users, working across web, mobile, and API layers in a SAFe Agile environment and deploying through AWS CI/CD pipelines. I built and owned a four-layer performance and load testing framework spanning the API, database, web, and Android layers, taking a system from failing a 50-concurrent-user test to sustaining 200+ with peaks of 250, then wired performance gates into CI/CD, so regressions fail the build rather than reaching production. Earlier, I led a team of three developers at Gretrix, ran an A/B testing program that produced a measurable relative conversion lift for a high-volume e-commerce client (carcovers.com), and designed and owned a Python/Flask API as sole developer at PRT-Solutions.

Experience

Ascend SC — Houston, TX.

Full-Stack Software Engineer (Full-Time) — 09/2023 - 09/2026

- Designed and built enterprise-scale supply chain web applications using PostgreSQL, Express.js, React.js, and Node.js, delivering inventory tracking, order management, and shipment visibility modules capable of use by 200+ internal and client users.
- Rebuilt the unique asset upload flow end to end in React, replacing a CSV-only modal with one supporting .csv, .xls, and .xlsx, adding format and data validation plus a results table surfacing per-file upload status and failure reasons.
- Built an integration that parsed vendor packing lists into the application's data model, eliminating manual re-entry of shipment data.
- Built and owned a four-layer performance and load testing framework (API, database, web UI, Android) using JMeter orchestrated through Taurus YAML against Node.js/Express REST and GraphQL APIs; initial testing showed the system could not complete a 50-concurrent-user run, and after working through bottlenecks including slow PostgreSQL queries and connection pooling with the web and mobile teams, it sustained 200+ concurrent users with peaks of 250.
- Collaborated in a SAFe Agile environment with Product Management, UX designers, and QA, participating in PI planning, managing Git branching and code reviews, and deploying through AWS-based CI/CD pipelines (CodePipeline, EC2, RDS, S3).
- Built automated web UI regression suites with Selenium WebDriver, Mocha, Taurus, and JMeter using the Page Object Model and implemented automated testing for API, Web UI, Mobile and backend layers, cutting manual regression effort from days to hours.
- Integrated Taurus-driven performance tests into CI/CD pipelines with pass/fail thresholds on response time and error rate, catching performance regressions before release and giving stakeholders clear trend reports.
- Developed mobile test automation for Android applications with Appium Robot Framework, using reusable keyword libraries to cover login, data entry, and offline sync scenarios across multiple devices and OS versions.

Halliburton — Houston, TX

Software Developer (Contract) — 04/2022 - 09/2022

- Converted legacy codebase resolving bugs, creating new features, migrating data, and implementing Authentication flows to secure data access.
- Created scripts to migrate jobs, large-scale data, and other tables across infrastructure using Git to manage versioning and coordinate deployments.
- Utilization of current standards and practices to push new features, migrations, and bug fixes to ensure scalable high-quality code to maximize app performance.
- Refactored legacy classes and functions toward modular, maintainable JavaScript (ES6+), applying async/await for asynchronous operations to improve code reuse and separation of concerns.
- Worked in Linux environments for development, scripting, and deployment; used Docker for consistent local development; troubleshot production issues through log investigation on Azure.

Gretrix — Remote

Full Stack Software Developer (Contract | Full-Time) — 06/2021 - 05/2022

- Managed a team of 3 junior developers in full application builds and issue resolution for Gretrix clients, achieving project goals efficiently.
- Collaborated closely with multiple clients to solve advanced issues regarding data analytics, web development and other software related issues, using strong communication to align requirements and outcomes.
- Leveraged A/B tests through Google Optimize, Google Tag Manager, and Google Analytics I was able to help our client (Carcovers.com) with an extra 1% relative conversion lift.
- Developed custom code to automate tasks on client's server to reduce down-time and keep data flowing from the client's database to their custom front end, improving database management and reliability.
- Develop fully responsive web applications from the ground up using 'mobile first' approach, media queries, and other up-to-date industry standard technologies.
- Collaborate with other team members to develop mobile application for iOS and Android using React Native, implementing an offline first approach with react-native-offline and redux modules ensuring app functionality whether online or offline.
- Built Python web scrapers and automation scripts for client data collection, parsing and normalizing results into client systems.
- Containerized client applications with Docker and administered Linux servers for client deployments and automation.
- Deployed and troubleshot client workloads across AWS, GCP, and Azure, primarily through log investigation.

Experience

Look Far Labs — Remote (Partnered with Gretrix)

Frontend/React.js Developer (Part-Time through Gretrix) — 09/2021 - 05/2022

- Built front-end features in TypeScript and React.js, including fully functional interactive tables for the client's custom CMS.
- Engineered reusable custom React components used throughout the application, and built out the interface for a custom purchasing agent and foreman web application.
- Managed application state with Context API and React Hooks, using Formik for form handling and Tailwind CSS for rapid design and styling iteration.
- Collaborated with project managers, designers, and back-end developers to resolve technical challenges and keep delivery on schedule.

PRT-Solutions — Houston, TX

Full Stack Software Engineer (Full-Time) — 09/2020 - 06/2021

- Designed and owned a Python/Flask API with SQLAlchemy as sole developer on a home automation platform, building the data model, endpoints, and persistence layer end to end against MySQL, with SQLite handling on-device IoT state; deployed across AWS and GCP.
- Launched a functional, scalable mobile app for iOS and Android using React Native, SQL and Python while leveraging JavaScript for cross-platform logic and applying problem solving to overcome platform-specific constraints.
- Upgraded RESTful API endpoints, keeping this app flexible and lightweight by improving REST APIs performance and reliability.
- Adopted up-to-date standards and best practices by implementing ES6 standards, maintaining proper documentation, and writing simple yet elegant code.
- Planned and develop engaging and fully responsive web application using React.js, ensuring to keep code clean and concise while utilizing best practices, such as keeping components clear and dynamic, which elevates component re-usability.
- Expanded cross-platform mobile application using React Native, leveraging a single codebase delivering seamless and native-like user experiences for both Android and iOS platforms.

Skills

Languages: — JavaScript (ES6+), TypeScript, Python, SQL, HTML5, CSS3, SCSS

Frontend: — React.js, React Native, Redux, Context API, React Hooks, Formik, Tailwind CSS, Apollo Client, responsive and mobile-first design, media queries

Backend: — Node.js, Express.js, Flask, SQLAlchemy, REST APIs, GraphQL, OpenAPI, microservices, serverless architecture

Databases: — PostgreSQL, MySQL, SQLite, SQL Server, data modeling, schema design, query optimization, ETL

Cloud & DevOps: — AWS (EC2, S3, RDS, Lambda, CodePipeline, Amplify, IAM, VPC, API Gateway), Google Cloud Platform, Azure, Docker, Linux, CI/CD pipelines, GitHub Actions, NGINX, Apache

Testing & QA: — JMeter, Taurus, Selenium WebDriver, Mocha, Appium, Robot Framework, unit / integration / end-to-end testing, performance and load testing, Page Object Model, automated regression suites

Analytics & Experimentation: — Google Analytics, Google Tag Manager, Google Optimize, A/B testing, Looker Studio, conversion tracking

Practices & Tools: — Git, GitHub, BitBucket, Jira, SAFe Agile, Scrum, SDLC, code review, system design, OOP, MVC, clean code, Figma, VS Code, PyCharm, Xcode, Contentful, JourneyApps (Oxide)

Certifications

AWS Certified Cloud Practitioner — Amazon Web Services

JourneyApps Certification — JourneyApps

Education

University of Houston Clear Lake — Clear Lake, TX

BAS-Information Technology — 08/2018 - 05/2027

Houston Community College — Houston, TX

AAS-Network and Computer Systems Administration — 08/2015 - 05/2017

- Relevant Coursework: Networking, Windows Server Administration, Linux Server Administration, Web Development
